Enantiopure Double-Helical Phenylene Ethynylene Cyclophynes with the 2,2'-Binaphthyl Template

De-Lie An,* $^{[a]}$ Ying-Jun Zhang, $^{[a]}$ Qiang Chen, $^{[a]}$ Wen-Ying Zhao, $^{[a]}$ Hong Yan, $^{[a]}$ Akihiro Orita, $^{[b]}$ and Junzo Otera* $^{[a,b]}$

Abstract: New types of enantiopure compounds were synthesized to gain better insight into the structural features of phenylene ethynylene cyclophynes. Besides the previously obtained *meta*-substituted arylene ethynylenes, **1**, *ortho*-connected phenylene ethynylene units were incorporated to give cyclophynes with *ortho/meta* and *ortho/ortho* connection modes, **2** and **3**. Furthermore, a diphenylethyne compo-

nent was also accommodated in 4. Both ab initio calculations and NMR spectra suggest a large amount of strain for 2 but less strain for 3 and 1a, the latter having the smallest ring size among cyclophynes with the *meta/meta*

Keywords: acetylenes • chirality • cyclophanes • cyclophynes • helical structures

connection mode. The CD spectra of 2 and 3 showed a characteristic shoulder at around 340 nm, similar to the case of 1a. This implies that the aromatic acetylene bonds cross over each other in the double-helical structure. These results indicate that chirality information is useful for probing the persistency of molecular shape.

Introduction

Modern cyclophane chemistry has witnessed great advances in its acetylenic family, cyclophynes, in the context of growing interest in carbon-rich materials and shape-persistent macrocyclic molecules. In particular, numerous aromatic cyclophynes have appeared owing to rapidly developed technology for the synthesis of aromatic acetylenes. Some of these molecules are chiral but, unfortunately, obtained as racemates except for only a few. Previously, we synthesized double-helical cyclophynes composed of *meta*-connected phenylene ethynylene frameworks with 2,2'-binaphthyl templates such as (R,P)-1a and -1b. The CD spectra of

these molecules displayed dramatic variations of the Cotton effect that depended on ring size, thus implying that molecular chirality, once enantiopure materials have been acquired, can provide a probe for the persistency of molecular shape. Accordingly, we were intrigued by the design of other cyclophynes with double helicity in enantiopure form. In phenylene ethynylene cyclophynes, the substitution pattern of the aromatic rings directs the orientation of the acetylenic bonds, thereby defining the molecular structure and its persistency. In this study, the ortho connection of the ethynyl groups on the phenylene ring was newly taken into account to give (R,P)-2 and -3. Furthermore, a diphenylethyne component was also accommodated to provide (R,P)- and (S,M)-4. The shape persistency of these compounds, together with 1 for comparison, will be discussed on the basis of the NMR and CD spectra.

Resuls and Discussion

The synthesis of (R,P)-2 and -3 is shown in Scheme 1. *meta*-Substituted phenylethynyl compounds $\mathbf{8a}$ and $\mathbf{9a}$ were prepared according to our previous method. The corresponding *ortho*-substituted derivatives, $\mathbf{8b}$ and $\mathbf{9b}$, were obtained analogously. Desilylation of $\mathbf{8a}$ and $\mathbf{8b}$ afforded *meta*- and *ortho*-triazenes $\mathbf{10a}$ and $\mathbf{10b}$, respectively. Next, coupling of $\mathbf{9a}$ or $\mathbf{9b}$ with $\mathbf{10b}$ afforded $\mathbf{11a}$ or $\mathbf{11b}$. Conversion of tri-

azenes 11a and 11b into iodides 12a and 12b followed by desilyation afforded precursors 13a and 13b, respectively. Subjection of these compounds to intramolecular cyclization afforded (R,P)-2 and (R,P)-3.

toluene

Diphenylethyne-containing (R,P)- and (S,M)-4 were prepared according to the procedures shown in Scheme 2. Reaction of 6 with building block 15 afforded 16, which was then converted into iodide 17. Coupling between 10a and 17 followed by the usual transformations via 18 and 19 afforded precursor 20. Subjection of (R)and (S)-20 to intramolecular coupling afforded (R,P)- and (S,M)-4, respectively.

The molecular structures of 1a, 2, and 3 were calculated at the HF/6-31G* level.[4] The results are summarized in Table 1, and the space-filling models are shown in Figure 1. Corev-Pauling-Koltun (CPK) models of these compounds suggest very slight flexibility arising from fluttering of the dihedral angle between the biphenyl faces, although 2 is more rigid than the others. This is in accord with the smaller enthalpy of formation of 2 relative to 1a and 3. Apparently, 2 is more strained unsymmetrical because of ortho/meta mixed connecting modes; this is reflected in the bond angles of the C(sp) atoms, which are smaller for 2 (169.7-174.5°) than for 1a and 3 (174.0-177.8°). At first glance, it seemed to us that the conformation of 3 with ortho/ortho connections might be tightest, but this is not the case because

of the high molecular symmetry. This indicates clearly that the persistency of molecular shape is not only governed by the connectivity; the symmetry of the whole molecule plays a more important role. Accordingly, it is quite natural that 1a, which bears symmetrical meta/meta connections, has the most relaxed conformation of the three compounds.

The NMR spectral data are in good agreement with the above calculations. As summarized in Table 2, the ¹³C NMR spectra showed acetylenic carbon signals between 89.6 and

Compound	ortho-H	Acetylenic carbon atoms
1a	7.92 ^[3a]	90.4, 92.1 ^[3a]
1b	$7.49^{[3b]}$	89.1, 89.7, 92.1 ^[3b]
2	7.51	92.1, 92.2, 93.2, 94.2
3		91.4, 92.3
4	7.64	89.6, 89.7, 89.9, 91.7, 91.8

92.3 ppm for 3 and 4. Moreover, 1a and 1b also gave similar results (89.1-92.1 ppm). On the other hand, the acetylenic carbon nuclei of 2 resonated at higher frequency (92.1-94.2 ppm). This is reminiscent of bent atomic arrangements around acetylenic carbon atoms induced by the strained structure.^[5] The ¹H NMR signal of the proton located at the double-ortho position in the meta-connected phenylene is also diagnostic of the molecular structures. A singlet appeared at 7.51 and 7.64 ppm in 2 and 4, respectively, whereas 1a exhibited this signal at 7.92 ppm. Clearly, the proton in 1a is situated closer to the phenyl ring of another chain, thus undergoing paramagnetic deshielding effectively. X-ray crystallography^[3a] as well as the above molecular modeling show that the central benzene rings in 1 are somewhat tilted from planarity due to the close contact of the protons at the double-ortho position.

The CD spectra of the relevant compounds are illustrated in Figure 2. A strong positive band appeared at around 300 nm for the R,P enantiomers of 1a, 2, and 3. Furthermore, a shoulder can also be seen in the longer-wavelength region (330-340 nm). Previously, we disclosed that the positive band in this region is attributable to aromatic acetylenic bonds that cross each other in the *P* helicity.^[6]

In contrast, a negative band appeared at around 340 nm for (R,P)-4, as was also observed for (R,P)-1b. [3b] We also

disclosed that such alteration is a result of loose arylene ethynylene macrocycles that do not bear fixed crossing aromatic acetylenic bonds. As the magnitude of the negative band of (R,P)-4 is comparable to that of (R,P)-1b and is much smaller than those of the higher homologues with 52-and 62-membered cycles, the structure of (R,P)-4 is not completely flexible but strained to some degree. Of further note is the perfect reversal of the CD spectrum of (S,M)-4, which is indicative of the enantiopurity of the compounds obtained here.

Conclusions

We have synthesized novel phenylene ethynylene cyclophynes in enantiopure form. On the basis of ab initio calculations, the *ortho* connection of ethynyl groups on the benzene ring has proved, as expected, to induce a more rigid structure than *meta* connection. However, it was found that molecular symmetry contributes a greater extent to the structure and causes the unsymmetrical *ortho/meta* mixed connecting modes to be most strained. The strained sp-hybridized carbon atoms were explicitly detected by means of ¹³C NMR spectra. More interestingly, a slight difference in shape persistency between these molecules was detected by CD spectroscopy. In other words, the high sensitivity of CD spectroscopy is promising for probing molecular persistency.

Experimental Section

General

All reactions were carried out under an atmosphere of nitrogen with freshly distilled solvents, unless otherwise noted. Melting points were determined with a Taike XT-4 micromelting-point apparatus and are uncorrected. THF was distilled from sodium/benzophenone. Other solvents such as toluene and diisopropylamine were distilled from CaH₂. A solution of BuLi in hexane was purchased from Aldrich and titrated before use by the Gilman method. [Pd(PPh₃)₂Cl₂] was purchased from Merck. NMR spectra were recorded on Varian INOVA-400 or JEOL Lambada 500 instruments with tetramethylsilane as an internal reference. Mass

spectra were recorded on an LCQ-Advantage LC/MSⁿ (atmospheric pressure chemical ionization (APCI), Thermo-Finnigan) mass spectrometer. Optical rotations were obtained on a JASO P-1010 polarimeter. UV/Vis and CD spectra were recorded on LabTech UV-2000/2100 and JASO J-820 spectrometers, respectively. IR spectra were recorded on a WQF-410 spectrometer.

Syntheses

Compounds 5, 6, 7, 8a, and 9a were prepared according to the previously published procedures.^[3] The synthetic procedures for 11b, 12b, 13b, and 15–20 are given in the Supporting Information.

8b: A 100-mL flask was charged with 6 (743 mg, 1.98 mmol), 7b (500 mg, 1.65 mmol), [(Ph₃P)₂PdCl₂] (42 mg, 0.06 mmol), CuI (11 mg, 0.06 mmol), diisopropylamine (8 mL), and toluene (30 mL). After the mixture was stirred at 80°C for 11 h, it was cooled to room temperature and filtered. The filtrate was poured into aqueous NH₄Cl and extracted with ethyl acetate. The extract was then washed with brine, dried over MgSO4, and filtered. The solvent was evaporated in vacuo, and the residue was subjected to chromatography (SiO2, hexane/CH2Cl2=2:1) to give 8b (743 mg, 82%) as a yellow solid. M.p.: 132–133°C; $[\alpha]_D^{26.7} = +498.7$ (c =0.1 м, CHCl₃) for *R* enantiomer; IR (KBr): $\tilde{\nu}$ = 2927 (С_{агот}-H), 2145 (С \equiv C), 1398, 1086, 849, 750 cm⁻¹; ¹H NMR (CDCl₃, 400 MHz): $\delta = -0.30$ (s, 9H, TMS), 1.32 (t, J=7.2 Hz, 6H), 3.77 (q, J=7.2 Hz, 4H), 6.13 (d, J=7.2 Hz, 1 H), 6.76 (t, J = 7.2 Hz, 1 H), 7.07 (t, J = 8.0 Hz, 1 H), 7.23 (d, J =8.0 Hz, 1H), 7.28–7.31 (m, 3H), 7.40 (d, J=8.4 Hz, 1H), 7.44–7.49 (m, 2H), 7.67 (d, J = 8.4 Hz, 1H), 7.69 (d, J = 7.6 Hz, 1H), 7.90 (d, J = 8.4 Hz, 2H), 7.93 ppm (d, J = 8.4 Hz, 2H); 13 C NMR (CDCl₃, 100 MHz): $\delta =$ -0.71 (TMS), 10.2 (CH₃), 14.4 (CH₃), 41.0 (CH₂), 48.4 (CH₂), 92.4 (C \equiv), 93.2 (C \equiv), 98.5 (C \equiv), 104.9 (C \equiv), 116.5 (CH), 118.2 (C), 121.5 (C), 122.3 (C), 124.3 (CH), 126.0 (CH), 126.4 (CH), 126.5 (CH), 126.5 (CH), 126.6 (CH), 126.9 (CH), 127.6 (CH), 127.7 (CH), 127.8 (CH), 127.9 (CH), 128.0 (CH), 128.3 (CH), 128.4 (CH), 132.5 (C), 132.7 (C), 132.8 (C), 133.0 (CCH), 139.6 (C), 141.4 (C), 151.5 ppm (C); MS (APCI): m/z $(\%) = 550.0 [M+1]^+ (100), 551.0 [M+2]^+ (42), 552.0 [M+3]^+ (16).$

9b: A 50-mL sealed tube was charged with 8b (319 mg, 0.58 mmol) and methyl iodide (30 mL). The solution was kept at 120 °C for 20 h. The reaction mixture was filtered and then evaporated. The residue was subjected to chromatography (SiO $_2$, hexane/CH $_2$ Cl $_2$ = 5:1) to give $\bf 9b$ (304 mg, 91%) as a pale-yellow solid. M.p.: 48–49°C; $[a]_D^{26.2} = +510.6$ (c = 0.1 M, CHCl₃) for R enantiomer; IR (KBr): $\tilde{\nu} = 3055$ (C_{arom}-H), 2954, 2146 (C \equiv C), 1587 (C_{arom}-C), 1248, 845, 748 cm⁻¹; ¹H NMR (CDCl₃, 400 MHz): $\delta = -0.26$ (s, 9H, TMS), 6.79 (d, J = 8.0 Hz, 1H), 6.82 (t, J =8.0 Hz, 1 H), 7.09 (t, J = 7.6 Hz, 1 H), 7.24 (d, J = 8.8 Hz, 1 H), 7.30 (d, J =7.6 Hz, 1H), 7.35 (t, J = 8.0 Hz, 2H), 7.46 (t, J = 8.4 Hz, 1H), 7.48 (t, J =8.4 Hz, 1H), 7.63 (d, J = 8.0 Hz, 1H), 7.67 (d, J = 8.4 Hz, 1H), 7.82 (d, J =8.4 Hz, 1H), 7.90 (d, J=7.6 Hz, 2H), 7.94 ppm (d, J=8.8 Hz, 2H); ¹³C NMR (CDCl₃, 100 MHz): $\delta = -0.65$ (TMS), 92.9 (C \equiv), 94.6 (C \equiv), 98.9 (C \equiv), 99.8 (C \equiv), 104.7 (C), 121.1 (2C), 121.7 (C), 126.5 (CH), 126.6 (CH), 126.6 (CH), 126.6 (CH), 126.8 (CH), 126.8 (CH), 127.3 (CH), 127.8 (CH), 127.9 (CH), 127.9 (CH), 127.9 (CH), 128.2 (CH), 128.6 (CH), 128.9 (CH), 130.0 (C), 132.6 (CH), 132.8 (C), 133.2 (C), 133.3 (C), 138.3 (CH), 140.0 (C), 141.1 ppm (C); MS (APCI): m/z (%) = 577.0 [M+ $1]^+$ (100), 578.0 $[M+2]^+$ (37), 579.1 $[M+3]^+$ (14).

10a: A 50-mL flask was charged with **8a** (250 mg, 0.5 mmol), K_2CO_3 (632 mg, 5 mol), THF (10 mL), and methanol (10 mL). The resulting mixture was stirred at room temperature for 5 h. The reaction mixture was poured into water and extracted with ethyl acetate, and the organic layer was dried over MgSO₄ and filtered. The solvent was evaporated, and the residue was subjected to chromatography (SiO₂, hexane/CH₂Cl₂=5: 1) to give **10a** (200 mg, 92 %) as a pale-yellow oil. ¹H NMR (CDCl₃ 500 MHz): δ =1.25 (br s, 6H, 2×CH₃), 2.77 (s, 1H, C≡CH), 3.73 (q, J=7.02 Hz, 4H, 2×CH₂), 6.53 (d, J=7.65 Hz, 1H), 6.94 (s, 1H), 7.05 (t, J=7.80 Hz, 1H), 7.19–7.32 (m, 5H), 7.45–7.49 (m, 2H), 7.74–7.77 (m, 2H), 7.90–7.95 ppm (m, 4H); ¹³C NMR (CDCl₃ 125 MHz): δ =11.7 (CH₃), 13.7 (CH₃), 41.0 (CH₂), 48.4 (CH₂), 80.7 (CH≡), 82.8 (C≡), 88.6 (C≡), 94.0 (C≡), 120.4 (C), 120.5 (CH), 121.6 (C), 122.9 (CH), 123.3 (C), 126.1 (CH), 126.3 (CH), 126.4 (CH), 126.5(8) (CH), 126.6(5) (CH), 126.7 (CH), 127.8 (CH), 127.9 (CH), 127.9 (CH), 128.0 (CH), 128.0 (CH), 128.0 (CH),

128.1 (CH), 128.3 (CH), 128.8 (CH), 132.4 (2 C), 132.7 (C), 133.0 (C), 139.6 (C), 140.7 (C), 150.7 ppm (C).

10b: A round-bottomed flask was charged with 8b (682 mg, 1.24 mmol), K₂CO₃ (497 mg, 3.6 mmol), THF (30 mL), and methanol (30 mL). The resulting mixture was stirred at room temperature for 1.5 h. The reaction mixture was poured into water and extracted with ethyl acetate, and the organic layer was dried over MgSO4 and filtered. The solvent was evaporated, and the residue was subjected to chromatography (SiO2, hexane/ $CH_2Cl_2=3:1$) to give **10 b** (550 mg, 93 %) as a yellow powder. M.p.: 178-180 °C; $[a]_D^{26.6} = +456.7$ (c = 0.1 M, CHCl₃) for R enantiomer; IR (KBr): $\tilde{v} = 3309 \text{ (C} \equiv \text{C-H)}, 2970 \text{ (C}_{arom} \text{-H)}, 2198 \text{ (C} \equiv \text{C)}, 1398, 1090, 822,$ 752 cm⁻¹; ¹H NMR (CDCl₃, 400 MHz): $\delta = 1.32$ (t, J = 7.2 Hz, 6H), 3.77 (q, J=7.2 Hz, 4H), 6.30 (d, J=7.6 Hz, 1H), 6.79 (t, J=7.6 Hz, 1H), 7.09(t, J=7.6 Hz, 1 H), 7.24 (d, J=7.6 Hz, 1 H), 7.24 (d, J=8.8 Hz, 2 H), 7.29(t, J=7.6 Hz, 1H), 7.31 (t, J=7.2 Hz, 1H), 7.47 (t, J=8.0 Hz, 2H), 7.72(d, J=8.8 Hz, 1H), 7.75 (d, J=8.4 Hz, 1H), 7.91 (d, J=8.0 Hz, 1H), 7.91 ppm (d, J = 8.4 Hz, 1 H); ¹³C NMR (CDCl₃, 100 MHz) $\delta = 10.2$ (CH_3) , 14.4 (CH_3) , 41.0 (CH_2) , 48.4 (CH_2) , 80.5 $(CH \equiv)$, 83.0 $(C \equiv)$, 92.6 $(C \equiv)$, 92.9 $(C \equiv)$, 116.6 (CH), 118.1 (C), 120.6 (C), 122.5 (C), 124.4 (CH), 126.2 (CH), 126.3 (CH), 126.6 (CH), 126.7 (CH), 126.7 (CH), 126.8 (CH), 127.9 (CH), 127.9 (CH), 127.9 (CH), 128.0 (CH), 128.4 (CH), 128.6 (CH), 128.9 (CH), 132.6 (2×C), 132.7 (C), 133.1 (CH), 133.1 (C), 139.2 (C), 141.0 (C), 151.6 ppm (C); MS (APCI): m/z (%)=377.3 $[M-N_3Et_2]^+$ (100), 478.1 $[M+1]^+$ (72), 479.1 $[M+2]^+$ (23).

11a: A 100-mL flask was charged with 9a (242 mg, 0.42 mmol), 10b (229 mg, 0.48 mmol), [(Ph₃P)₂PdCl₂] (11 mg, 0.016 mmol), CuI (3 mg, 0.016 mmol), diisopropylamine (5 mL), and toluene (20 mL). After the mixture was stirred at 80 °C for 15 h, it was cooled to room temperature and filtered. The filtrate was poured into aqueous NH₄Cl and extracted with ethyl acetate. The extract was then washed with brine, dried over MgSO₄, and filtered. The solvent was evaporated in vacuo, and the residue was subjected to chromatography (SiO₂, hexane/CH₂Cl₂=3:1) to give **11a** (287 mg, 73%) as a yellow solid. M.p.: 101–102 °C; $[\alpha]_D^{269.5}$ = +104.5 ($c=0.1 \,\mathrm{M}$, CHCl₃) for R enantiomer; IR (KBr): $\tilde{v}=3442$, 3057 $(C_{arom}-H),\,2960,\,2204,\,2146\,\,(C\,\equiv\,C),\,1593\,\,(C_{arom}-C),\,1408,\,1248,\,818,\,750,$ 688 cm⁻¹; ¹H NMR (CDCl₃, 400 MHz): $\delta = -0.28$ (s, 9H), 1.27 (t, J =7.6 Hz, 6H), 3.73 (q, J = 7.6 Hz, 4H), 6.23 (d, J = 7.6 Hz, 1H), 6.28 (s, 1 H), 6.40 (d, J = 8.0 Hz, 1 H), 6.43 (d, J = 7.2 Hz, 1 H), 6.78 (t, J = 7.6 Hz, 2H), 7.08 (t, J=7.6 Hz, 1H), 7.24 (d, J=7.6 Hz, 1H), 7.25-7.34 (m, 8H), 7.39–7.50 (m, 4H), 7.65 (d, J=8.0 Hz, 1H), 7.70–7.77 (m, 3H), 7.82– 8.00 ppm (m, 8H); 13 C NMR (CDCl₃, 100 MHz): $\delta = 11.1$ (CH₃), 14.8 (CH_3) , 41.9 (CH_2) , 48.8 (CH_2) , 89.7 $(C\equiv)$, 89.9 $(C\equiv)$, 92.6 $(C\equiv)$, 92.6 $(C \equiv)$, 92.7 $(C \equiv)$, 93.1 $(C \equiv)$, 98.7 $(C \equiv)$, 104.8 $(C \equiv)$, 116.7 (CH), 118.2 (C), 121.3 (C), 121.4 (C), 121.5 (C), 122.6 (C), 123.0 (C), 123.2 (C), 124.3 (CH), 126.2 (CH), 126.4 (CH), 126.5 (4×CH), 126.6 (3×CH), 126.7(CH), 126.9 (CH), 127.5 (CH), 127.6 (CH), 127.8 (2CH), 127.9 (2CH), 127.9 (2CH), 128.0 (2×CH), 128.0 (2CH), 128.2 (CH), 128.4 (CH), 128.5 (CH), 130.4 (CH), 130.7 (CH), 132.4 (C), 132.6 (C), 132.7 (C), 132.7 (C), 132.8 (C), 133.0 (CH, 2×C), 133.6 (CH), 133.7 (C), 139.6 (C), 140.3 (C), 140.4 (C), 141.1 (C), 151.7 ppm (C); MS (APCI): m/z (%)=926.3 $[M+1]^+$ (79), 927.4 [M+2]⁺ (100), 928.4 [M+3]⁺ (52), 929.4 [M+4]⁺ (27), 930.4 $[M+5]^+$ (16).

12a: A 50-mL sealed tube was charged with 11a (259 mg, 0.28 mmol) and methyl iodide (30 mL). The solution was kept at 120 °C for 20 h. The reaction mixture was filtered and then evaporated. The residue was subjected to chromatography (SiO₂, hexane/CH₂Cl₂=5:1) to give 12a (230 mg, 87 %) as a pale-yellow solid.
