# Pd<sup>0</sup>-Catalyzed Coupling Cyclization Reaction of Aryl or 1-Alkenyl Halides with 1,2-Allenyl Ketones: Scope and Mechanism. An Efficient Assembly of 2,3,4-, 2,3,5-Tri- and 2,3,4,5-Tetrasubstituted Furans

### Shengming Ma,\* Junliang Zhang, and Lianghua Lu<sup>[a]</sup>

**Abstract:** Described herein is the Pd<sup>0</sup>-catalyzed coupling cyclization reaction of 1,2-allenyl ketones with organic halides leading efficiently and conveniently to not only 2,3,4- and 2,3,5-trisubstituted furans but also 2,3,4,5-tetrasubstituted furans. Furthermore, this method showed high substituent-loading capability and tolerance of various substituents. The reactions of 1,2-allenyl ketones **1e**, **1p**, **1q**, and deuterated [D]**1c** were performed for a mechanistic study, which demonstrated that instead of an enolization pathway, the reaction may proceed via the intermediacy of dienolate palladium and intramolecular nucleophilic attack on the  $\pi$ -allyl palladium intermediate by the carbonyl oxygen.

**Keywords:** allenes • C-C coupling • cyclization • ketones • palladium

#### Introduction

Furans, one of the most prominent classes of heterocyclic compounds, can be found in many naturally occurring products, [1] commercially important pharmaceuticals, and compounds with flavor and fragrance. [2] They are also considered as important synthetic intermediates for the preparation of numerous cyclic and acyclic compounds. [3] Usually, 2,3,4-, 2,3,5-trisubstituted and 2,3,4,5-tetrasubstituted furans were synthesized from either derivatization of simple furans [4] or cyclization of acyclic precursors. [5–10] Due to furans' potentials and diversity, it is desirable to develop a general methodology for their synthesis from acyclic precursors.

Marshall and co-workers reported the  $Rh^I$ - or  $Ag^I$ -catalyzed cycloisomerization of 1,2-dienyl ketones to afford substituted furans [Eq. (1)]. They also demonstrated the application of this reaction to the synthesis of the enantiomers of natural products such as furanocembrane rubifolide  $^{[12a]}$  and kallolide  $^{[12b]}$ 

Recently, Hashmi and co-workers reported the Pd<sup>II</sup>-catalyzed dimerization of terminal 1,2-allenyl ketones to afford

Fax: (+86) 21-6416-6128 E-mail: masm@pub.sioc.ac.cn 2,4-disubstituted furans [Eq. (2)]<sup>[13]</sup> and the Au<sup>III</sup>-catalyzed reaction of terminal 1,2-allenyl ketones with  $\alpha$ , $\beta$ -unsaturated ketones to afford 2,5-disubstituted furans [Eq. (3)].<sup>[14]</sup>

Quite recently, we developed a Pd<sup>II</sup>-catalyzed cross-coupling reaction of terminal 1,2-alleny ketones with 1,2-allenic acids to afford 2,4-disubstituted furans [Eq. (4)].<sup>[15]</sup>

In spite of the excellence of Marshall's, Hashmi's, and our reactions in terms of efficiency, there is still an obvious limitation in terms of the introduction of four substituents to furans. To our knowledge, the introduction of substituents at the 3- and/or 4-position of the corresponding unsubstituted

furans is difficult; thus, efficient and general methodologies for the synthesis of furans with substituents at some or all of the four positions are still of current interest.

During the course of our study on the cross-coupling cyclization reaction of functionalized allenes,<sup>[16]</sup> we noted that, due to the high substituent-loading capability and easy availability of 1,2-allenyl ketones, it would be possible to develop a general methodology for the synthesis of differently substituted furans from their coupling reaction with organic compounds containing an appropriate leaving group (Scheme 1).<sup>[17]</sup>

Scheme 1. Retrosynthetic analysis of polysubstituted furans.

In a previous communication,<sup>[18]</sup> we reported a palladium-catalyzed cyclization of 1,2-allenyl ketone with an organic halide to provide an efficient, general, and versatile route to polysubstituted furans with a unique assembly of substituents at the different positions of furans depending on the substitution style of both reactants. In this paper, we wish to discuss in detail the scope and mechanism of this reaction.

#### **Results and Discussion**

Synthesis of the starting 1,2-allenyl ketones:  $\gamma$ -Substituted 1,2-allenyl ketones  $\mathbf{1a} - \mathbf{e}$  were prepared by the treatment of 1,2-allenyl lithium (prepared by the reaction of 1,2-allene and nBuLi at  $-50\,^{\circ}$ C for 2 h) with N,N-dimethyl organic amide at  $-78\,^{\circ}$ C in THF (Scheme 2). [19] 1,2-Allenyl ketones  $\mathbf{1f} - \mathbf{g}$  were prepared by the reaction of phenyl acetyl chloride with the corresponding ylide (Scheme 3). [20]

Scheme 2. Synthesis of 1,2-allenyl ketones  $1\mathbf{a} - \mathbf{e}$ . i) nBuLi,  $-50\,^{\circ}$ C, THF,  $2\ h$ ; ii)  $R^{1}$ CONMe<sub>2</sub>,  $-78\,^{\circ}$ C, THF.

#### **Abstract in Chinese:**

Abstract in Chinese: 通过 1.2 — 联烯酮与有机卤化物在钯催化下的偶联环化反应,本文发展了一种方便有效地合成 2.3,4 —, 2.3,5 — 三取代和 2.3,4,5 — 四取代呋喃化合物的方法。同时,该方法还具有很强的取代基装载能力和容忍度。另外通过对 1.2 — 联烯基酮 1e,1p,1q 和氘代的[D]1c 偶联环化反应的研究,对反应的机理有了进一步的了解。研究表明该反应可能是通过共轭二烯醇钯中间体或羰基氧进攻 x — 烯丙基钯中间体进行的。

## Coupling cyclization of 1,2-allenyl ketones and organic halides

Synthesis of 2,3,5-trisubstituted furans: As a starting point, we studied the Pd<sup>0</sup>-catalyzed cyclization reaction of heptadeca-3,4-dien-2-one **1a** with iodobenzene **2a** under different reaction conditions, the results are summarized in Table 1. From Table 1, it is clear that the major side reaction is the cycloisomerization of **1a** to afford 2-methyl-5-dodecanylfuran **4a**. Fortunately, after some screening, we found that the Pd(PPh<sub>3</sub>)<sub>4</sub>-catalyzed cyclization reaction of **1a** with PhI could afford the expected two-component coupling cyclization product **3aa** in 88% yield together with the formation of **4a** in only 8% yield by using toluene as the solvent, Et<sub>3</sub>N-

Substituted Furans 2447–2456

[a] Unless otherwise specified, the reaction was carried out by using 1,2-allenyl ketone (1.5 equiv), organic halide (1.0 equiv) under conditions A. [b] Two equivalents of organic halides were used. [c] Two equivalents of 1,2-allenyl ketone were used. [d] The conformation of the C=C bond was E as determined by the coupling constant between the olefinic protons (J = 15.6 Hz).

www.chemeuri.org

These results show that i) both aryl halides and methyl (Z)-3-iodopropenoate afforded the expected 2,3,5-trisubstituted furans 3 in moderate to excellent yields and ii) different substituents such as aryl and alkyl group could be introduced to the 2,3,5-positions of furans, depending on the structures of the 1,2-alleny ketones and organic halides.

Synthesis of 2,3,4-trisubstituted furans: After studying the Pd<sup>0</sup>-catalyzed cyclization reaction of  $\gamma$ -substituted 1,2-allenyl ketones, we tried the cyclization reaction of  $\alpha$ -substituted 1,2-allenyl ketones. As expected,

the reaction occurred smoothly under conditions A giving air-sensitive<sup>[21]</sup> 2,3,4-trisubstituted furans in moderate to excellent yields (entries 1–4, Table 2). One thing that should be noted is that the allyl group in the  $\alpha$ -position of allenyl ketones has no influence on the reaction; this showed that the reaction is highly chemoselective (entry 4, Table 3).

Table 3. Efficient synthesis of 2,3,4-trisubstituted furans.[a]

	1		2	t	3

[a] Unless otherwise specified, the reaction was carried out by using allenyl ketone (1.5 equiv) and organic halide (1.0 equiv) under conditions A. [b] Two equivalents of 1,2-allenyl ketone were used.

Synthesis of 2,3,4,5-tetrasubstituted furans: With the encouragement of the above results, we were very interested in the cyclization reaction of  $\alpha, \gamma$ -disubstituted 1,2-allenyl ketones, since 2,3,4,5-tetrasubstituted furans<sup>[22]</sup> would be provided if the reaction succeeded. Under conditions A, we found the reaction did occur to afford the corresponding product 3ka in 70% yield. However, the cycloisomerization product 4k was also formed in 30% yield; this indicates that conditions A for the cross-coupling cyclization reaction of  $\alpha$  or  $\gamma$ -substituted 1,2-allenyl ketones are not yet efficient enough for the highly selective coupling cyclization of  $\alpha, \gamma$ -disubstituted 1,2-allenyl ketones (entry 1, Table 4). Fortunately, after several trials, we found that the Pd<sup>0</sup>-catalyzed cyclization reaction of 1,2-allenyl ketone 1k with PhI (2a) afforded the cross-coupling cyclization product 3ka in 92% yield and the cycloisomerization product 4k in only 8% yield using K<sub>2</sub>CO<sub>3</sub> as the base and

[a] NMR yield determined by using  $CH_2Br_2$  as the internal standard. The numbers in parenthesis are isolated yields. [b] The reaction was carried out under conditions A. [c]  $nBu_4N^+Br^-$  (0.2 equiv) was added (conditions B). [d] PhBr was used instead of PhI.

DMA as the solvent (entry 7, Table 4). A better result was obtained when 20 mol % of  $nBu_4NBr$  (TBAB) was added, and the reaction afforded the corresponding product 3ka as the only product in 90 % yield (isolated yield: 72 %; conditions B; entry 8, Table 4). The reaction of 1k with phenyl bromide is slow (Compare entries 8 and 9, Table 4).

By using conditions B, the reaction of various  $\alpha, \gamma$ -disubstituted allenyl ketones with different organic halides afforded the corresponding 2,3,4,5-tetrasubstituted furans with different substitution patterns in moderate to excellent yields (Table 5). Considering the easy available of  $\alpha, \gamma$ -disubstituted 1,2-allenyl ketones with different substituents, it is a very general, convenient, and versatile route to synthesize 2,3,4,5-tetrasubstituted furans (Scheme 6).

To our surprise, when p-methoxyphenyl iodide (2 f) was used as the organic halide, the reaction afforded an unexpected furan 3ka in 27% yield together with the normal

[a] Unless otherwise specified, the reaction was carried out by using allenyl ketone (1.0 equiv) and organic halide (2.0 equiv) under conditions B. [b] Two equivalents of allenyl ketone were used. [c] 1.6 equivalents of 1,2-allenyl ketone were used. [d] 0.4 equivalents of TBAB were used, unexpectedly **3ka** was also isolated in 27% yield (based on the organic halide used).

product  $3\mathbf{kf}$  (51%). The possible rational of formation of  $3\mathbf{ka}$  is shown as Scheme 7. The first oxidative addition of  $2\mathbf{f}$  generates the  $Pd^{II}$  intermediate 5. Then the reductive elimination of intermediate 5 and subsequent reoxidative addition regenerates a new  $Pd^{II}$  intermediate  $\mathbf{6}$ ,  $\mathbf{6}^{[23]}$  which subsequently treated with 1,2-allenyl ketone  $\mathbf{1k}$  affords the unexpected product  $\mathbf{3ka}$ .

**Mechanism**: A plausible mechanism of this cross-coupling cyclization reaction is depicted in Scheme 8. The oxidative addition of  $R^3X$  with  $Pd^0$  generates intermediate  $R^3PdX$  7. Then, carbopalladation of 7 with 1,2-allenyl ketone 1 affords the π-allyl palladium intermediate 8, which may generate a new π-allyl palladium intermediate 9 in the presence of a base (path a). The subsequent intramolecular nucleophile attack of the intermediate  $9^{[16]}$  will regenerate palladium(0) and afford the intermediate 10, which would furnish furan 3 upon

aromatization. An alternative reaction pathway of intermediate **8** is formation of palladium dienolate  $\mathbf{11}^{[24]}$  and the subsequent insertion of the C=C double bond into the oxopalladium bond to afford intermediate  $\mathbf{12}$  (path b).  $\beta$ -H elimination from intermediate  $\mathbf{12}$  would afford the furan  $\mathbf{3}$ 

Substituted Furans 2447 – 2456

Scheme 8. Plausible mechanisms of the Pd<sup>0</sup>-catalyzed coupling cyclization.

and HPdX, which would regenerate palladium(0) in the presence of a base. In addition, direct intramolecular nucle-ophile attack on intermediate **8** by the carbonyl oxygen atom will generate intermediate **13** and regenerate Pd<sup>0</sup> (path c).<sup>[25]</sup> Intermediate **13** will be deprotonated to afford **3** in the presence of a base.

In order to verify the mechanism, some control reactions were performed. The coupling cyclization of deuterated 1,2-allenyl ketone [D] $\mathbf{1c}$  with p-methoxycarbonylphenyl iodide ( $\mathbf{2c}$ ) produced non-deuterated  $\mathbf{3cc}$  [Eq. (5)],

which was confirmed by  $^{13}$ C NMR and  $^{1}$ H NMR analysis. This rules out the possibility of path a. The cyclization results of 1e and 1p affording furans 3ea and 3pc in the absence of  $\alpha'$ -H further support that this palladium(0)-catalyzed coupling cyclization reaction may occur via paths b or c [Eq. (6)].

Furthermore, it is interesting to note that the cyclization of 1p with an electron-donating methyl group on the phenyl ring afforded 3pc in 90% yield, while the cyclization of 1q with the electron-withdrawing trifluoromethyl group afforded 3qc in only 21% yield. The cyclization of a 1:1 mixture of 1p and 1q with 2c in a one-pot manner afforded the corresponding furans 3pc and 3qc in 81% and 11% yields, respectively (Scheme 9). These results further support the possibility of path c.

#### **Conclusion**

We have developed a palladium(0)-catalyzed coupling cyclization reaction of 1,2-allenyl ketones with organic halides. The advantages of this method are its generality, versatility, and efficiency not only for the synthesis of 2,3,4- and 2,3,5trisubstituted furans but also for the synthesis of 2,3,4,5-tetrasubstituted furans. Furthermore, this methodology shows high substituent-loading capability and tolerance of various substituents. Some control reactions for mechanistic studies

showed that instead of an enolization pathway, the reaction may proceed by the intermediacy of dienolate palladium and intramolecular nucleophilic attack on the  $\pi$ -allyl palladium intermediate by the carbonyl oxygen. Synthetic application for target molecules with potential activities is currently being carried out in our laboratory.

Scheme 9. The cyclization reactions of 1p and 1q with 2c.

#### **Experimental Section**

The starting 1,2-alleny ketones  $\mathbf{1b} - \mathbf{c}$ , [196]  $\mathbf{1f}$  [20] and  $\mathbf{1h} - \mathbf{j}$  [196] were prepared according to literature procedures.

**Typical procedure for preparation of 1,2-allenyl ketones 1**a – e: **Heptadeca-3,4-dien-2-one (1a)**: Pentadeca-1,2-diene<sup>[26]</sup> (5.0 g, 24 mmol) was treated with nBuLi (2.0 m in cyclohexane, 20 mmol) in THF at  $-50^{\circ}$ C for 2 h followed by the dropwise addition of N,N-dimethylacetamide (1.7 g, 20 mmol) at  $-78^{\circ}$ C. After being stirred for 2 h at  $-78^{\circ}$ C, the resulting solution was slowly transferred into an ice-cooled aqueous HCl solution (0.1 N, 400 mL) and extracted with ether. Drying over MgSO<sub>4</sub>, rotary evaporation, and column chromatography on silica gel (hexanes/ether=100:1) afforded **1a** (2.0 g, 40%) as a liquid. <sup>1</sup>H NMR (CDCl<sub>3</sub>, 300 MHz):  $\delta$  = 5.75 – 5.64 (m, 1H; C=C=CHCO), 5.58 (q,  $^{3}$ /H,H) = 6.4 Hz, 1H; HC=C=C), 2.30 (s, 3H; CH<sub>3</sub>), 2.30 – 2.04 (m, 2H; CH<sub>2</sub>), 1.70 – 1.50 (m, 2H; CH<sub>2</sub>), 1.44 – 1.18 (m, 18H; 9 CH<sub>2</sub>), 0.85 (t,  $^{3}$ /H,H) = 7.1 Hz, 3H; CH<sub>3</sub>); IR (neat):  $\bar{\nu}$  = 2926, 2856, 1947 (C=C=C), 1686 cm<sup>-1</sup>(CO); MS (70 eV): m/z

**1-Cyclohexylundeca-2,3-dien-1-one (1d)**: The reaction of deca-1,2-diene (2.76 g, 20.0 mmol) with *n*BuLi (2.0 m in cyclohexane, 20 mmol) and cyclohexanecarboxylic acid *N,N*-dimethylamide (3.10 g, 20.0 mmol) afforded **1d** (1.84 g, 37 %) as a liquid. <sup>1</sup>H NMR (CDCl<sub>3</sub>, 300 MHz):  $\delta$  = 5.70–5.60 (m, 1 H; C=C=CHCO), 5.60 – 5.50 (m, 1 H; CH=C=C), 2.90 – 2.75 (m, 1 H; COCH), 2.20 – 2.05 (m, 2 H; CH<sub>2</sub>), 1.90 – 1.60 (m, 5 H; 2 CH<sub>2</sub> and CH), 1.60 – 1.00 (m, 15 H; 7 CH<sub>2</sub> and CH), 0.86 (t, <sup>3</sup>*J*(H,H) = 7.2 Hz, 3 H; CH<sub>3</sub>); <sup>13</sup>C NMR (75.4 MHz, CDCl<sub>3</sub>):  $\delta$  = 212.27, 204.76, 96.01, 95.15, 46.67, 31.69, 29.42, 29.00, 28.98, 27.83, 25.79, 25.68, 25.61, 22.56, 14.00; IR (neat):  $\bar{v}$  = 1947 (C=C=C), 1676 cm<sup>-1</sup> (C=O); MS (70 eV): m/z (%): 248 (4.75) [M<sup>+</sup>], 83 (100) [ $C_6H_{11}^{++}$ ]; HRMS: calcd for  $C_{17}H_{28}$ O: 248.2140; found: 248.2143.

**2,2-Dimethyltrideca-4,5-dien-3-one (1e):** The reaction of deca-1,2-diene (3.4 g, 24.6 mmol) with nBuLi (10 mL, 2.0 m in cyclohexane, 20.0 mmol) and N,N-dimethylpivalamide (2.5 g, 19.3 mmol) afforded **1e** (1.5 g, 35 %).  $^1$ H NMR (CDCl<sub>3</sub>, 300 MHz):  $\delta = 6.08 - 6.00$  (m, 1 H; C=C=CHCO), 5.55 (q,  $^3J$ (H,H) =  $^5J$ (H,H) = 7.0 Hz, 1 H; CH=C=C), 2.40 - 2.20 (m, 2 H; CH<sub>2</sub>), 1.50 - 1.35 (m, 2 H; CH<sub>2</sub>), 1.35 - 1.10 (m, 8 H; 4 CH<sub>2</sub>), 1.20 (s, 9 H; 3 CH<sub>3</sub>), 0.88 (t,  $^3J$ (H,H) = 6.6 Hz, 3 H; CH<sub>3</sub>); IR (neat):  $\bar{v}$  = 1951 (C=C=C), 1722 (C=O), 1683 (C=C), 1670 cm<sup>-1</sup>; MS (70 eV): m/z (%): 222 (13.23) [M<sup>+</sup>], 207 (100) [M<sup>+</sup> - CH<sub>3</sub>]; HRMS: calcd for C<sub>15</sub>H<sub>26</sub>O: 222.1984; found: 222.1975.

1-Phenylhepta-1,2-dien-4-one (1g): A solution of phenylacetyl chloride (3.70 g, 24 mmol) in CH<sub>2</sub>Cl<sub>2</sub> was added dropwise to an ice-cooled (0°C) solution of 1-(triphenylphosphoranylidene)pentan-2-one (6.92 g, 20 mmol) and Et<sub>3</sub>N (3.03 g, 30 mmol) in dry CH<sub>2</sub>Cl<sub>2</sub> stirred under Ar. The reaction mixture turned yellow when the reaction was complete as monitored by TLC. The reaction mixture was concentrated, and Et2O was added to remove Ph<sub>3</sub>PO by precipitation, Filtration, evaporation, and purification by column chromatography on silica gel (hexanes/ether = 100:1) afforded 1g (1.30 g, 35 %) as a yellow liquid. <sup>1</sup>H NMR  $(300 \text{ MHz}, \text{CDCl}_3)$ :  $\delta = 7.40 - 7.20$ (m, 5H;  $C_6H_5$ ), 6.63 (d,  ${}^5J(H,H) = 6.6 Hz$ , 1H; CH = C = C), 6.14 (d,  ${}^{5}J(H,H) = 6.6 \text{ Hz}, 1 \text{ H}; C = C = CHCO), 2.65 - 2.50 \text{ (m, 2H; CH<sub>2</sub>)}, 1.68 - 1.55$ (m, 2H; CH<sub>2</sub>), 0.90 (t,  ${}^{3}J(H,H) = 7.2 \text{ Hz}$ , 3H; CH<sub>3</sub>);  ${}^{13}C$  NMR (75.4 MHz,  $CDCl_3$ ):  $\delta = 215.16$ , 200.48, 131.04, 128.96, 128.13, 127.21, 100.57, 98.52, 41.27, 17.89, 13.66; IR (neat):  $\tilde{v} = 1937$  (C=C=C), 1683 cm<sup>-1</sup> (C=O); MS (70 eV): m/z (%): 186 (9.78) [ $M^+$ ], 71 (100) [ $C_3H_7CO^+$ ]; HRMS: calcd for C<sub>13</sub>H<sub>14</sub>O: 186.1045; found: 186.1052.

Typical procedure for the preparation of 1k-p: 3-Butyldeca-3,4-dien-2one (1k): Oct-1-en-3-yne<sup>[27]</sup> (1.25 g, 11.5 mmol) was added to a solution of nBuLi (2 m in cyclohexane, 10 mmol) in dry THF (60 mL) stirred under Ar at  $-50\,^{\circ}$ C. The temperature was raised gradually to  $-25\,^{\circ}$ C and kept between -25 and -10 °C for 0.5 h. After the starting enyne had completely disappeared as determined by TLC, the reaction mixture was recooled to -78 °C. This was followed by the addition of a solution of N.Ndimethylacetamide (1.30 g, 15 mmol) in THF (10 mL). After being stirred for 2 h at -78°C, the reaction mixture was poured into ice-cooled HCl (0.2 N, 100 mL), extracted with ether (3  $\times$  50 mL), and dried over anhydrous MgSO<sub>4</sub>. After removal of the solvent under reduced pressure, the residue was purified by column chromatography on silica gel (hexanes/ ether = 100:1) to afford **1k** (1.07 g, 51 %). <sup>1</sup>H NMR (300 MHz, CDCl<sub>3</sub>):  $\delta$  = 5.56-5.40 (m, 1H; CH=C=C), 2.17 (s, 3H; CH<sub>3</sub>), 2.12-1.90 (m, 4H; 2CH<sub>2</sub>), 1.45 – 1.08 (m, 10 H; 5 CH<sub>2</sub>), 0.90 – 0.80 (m, 6 H; 2 CH<sub>3</sub>); <sup>13</sup>C NMR  $(75.4 \text{ MHz}, \text{ CDCl}_3) \delta = 212.32, 199.45, 109.69, 95.40, 31.33, 30.11, 28.69,$ 28.23, 26.88, 26.18, 22.36, 22.29, 13.96, 13.88; IR (neat):  $\tilde{v} = 1944$  (C=C=C), 1680 cm<sup>-1</sup> (C=O); MS (70 eV): m/z (%): 208 (2.77) [ $M^+$ ], 43 (100) [ $C_3H_7^+$ ]; HRMS: calcd for C<sub>14</sub>H<sub>24</sub>O: 208.1827; found: 208.1795.
